String manipulation with stringr:: CHEATSHEET

The **stringr** package provides a set of internally consistent tools for working with character strings, i.e. sequences of characters surrounded by quotation marks.

Detect Matches

str_detect(string, pattern, negate = FALSE) Detect the presence of a pattern match in a string. Also str like(). str detect(fruit, "a")

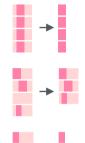

str_starts(string, pattern, negate = FALSE) Detect the presence of a pattern match at the beginning of a string. Also **str_ends()**. str starts(fruit, "a")

str_which(string, pattern, negate = FALSE) Find the indexes of strings that contain a pattern match. str which(fruit, "a")

str_locate(string, pattern) Locate the positions of pattern matches in a string. Also str locate all(). str locate(fruit, "a")

str_count(string, pattern) Count the number of matches in a string. str count(fruit, "a")

Subset Strings

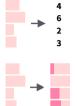

str_sub(string, start = 1L, end = -1L**)** Extract substrings from a character vector. str sub(fruit, 1, 3); str sub(fruit, -2)

str_subset(string, pattern, negate = FALSE) Return only the strings that contain a pattern match. str_subset(fruit, "p")

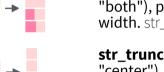

str_extract(string, pattern) Return the first pattern match found in each string, as a vector. Also **str_extract_all()** to return every pattern match. str extract(fruit, "[aeiou]")

str_match(string, pattern) Return the first pattern match found in each string, as a matrix with a column for each () group in pattern. Also str match all(). str match(sentences, "(althe) ([^ +])")

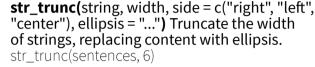

Manage Lengths

str_length(string) The width of strings (i.e. number of code points, which generally equals the number of characters). str length(fruit)

str_pad(string, width, side = c("left", "right", "both"), pad = " ") Pad strings to constant width. str_pad(fruit, 17)

str_squish(string) Trim whitespace from each end and collapse multiple spaces into single spaces. str squish(str pad(fruit, 17, "both"))

Mutate Strings

A STRING

a string

A STRING

a string

A String

str sub() <- value. Replace substrings by identifying the substrings with str_sub() and assigning into the results.

str sub(fruit, 1, 3) <- "str"

str replace(string, **pattern**, replacement) Replace the first matched pattern in each string. Also str_remove(). str_replace(fruit, "p", "-")

str_replace_all(string, pattern, replacement) Replace all matched patterns in each string. Also **str_remove_all()**.

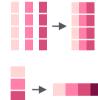

str replace all(fruit, "p", "-")

str_to_lower(string, locale = "en")¹ Convert strings to lower case. str to lower(sentences)

str_to_upper(string, locale = "en")¹ Convert strings to upper case. str_to_upper(sentences)

str_to_title(string, locale = "en")¹ Convert strings to title case. Also **str_to_sentence()**. str_to_title(sentences)

Join and Split

str_c(..., sep = "", collapse = NULL) Join multiple strings into a single string. str c(letters, LETTERS)

str flatten(string, collapse = "") Combines into a single string, separated by collapse. str flatten(fruit, ", ")

str_dup(string, times) Repeat strings times times. Also **str_unique()** to remove duplicates. str dup(fruit, times = 2)

str_split_fixed(string, **pattern**, n**)** Split a vector of strings into a matrix of substrings (splitting at occurrences of a pattern match). Also **str_split()** to return a list of substrings and **str_split_i()** to return the ith substring. str split fixed(sentences, " ", n=3)

str_glue(..., .sep = "", .envir = parent.frame()) Create a string from strings and {expressions} to evaluate. str_glue("Pi is {pi}")

parent.frame(), .na = "NA") Use a data frame, list, or environment to create a string from strings and {expressions} to evaluate. str_glue_data(mtcars, "{rownames(mtcars)} has {hp} hp")

str_glue_data(.x, ..., .sep = "", .envir =

Order Strings

str order(x, decreasing = FALSE, na last = TRUE, locale = "en", numeric = FÁLSE, ...)1 Return the vector of indexes that sorts a character vector. fruit[str order(fruit)]

str sort(x, decreasing = FALSE, na last = TRUE, locale = "en", numeric = FALSE, ...)1 **Sort a character vector.** str_sort(fruit)

Helpers

appl<e> banana p<e>ar

TRUE FALSE

This is a long sentence. **▼** This is a long

str_conv(string, encoding) Override the encoding of a string. str_conv(fruit,"ISO-8859-1")

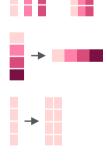

str_view(string, pattern, match = NA) View HTML rendering of all regex matches. str_view(sentences, "[aeiou]")

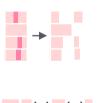

str_equal(x, y, locale = "en", ignore_case = FALSE, ...)¹ Determine if two strings are equivalent. str_equal(c("a", "b"), c("a", "c"))

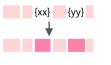

str_wrap(string, width = 80, indent = 0, exdent = 0) Wrap strings into nicely formatted paragraphs. str_wrap(sentences, 20)

¹ See **bit.ly/ISO639-1** for a complete list of locales.

Need to Know

Pattern arguments in stringr are interpreted as regular expressions after any special characters have been parsed.

In R, you write regular expressions as strings, sequences of characters surrounded by quotes ("") or single quotes(").

Some characters cannot be represented directly in an R string. These must be represented as **special characters**, sequences of characters that have a specific meaning., e.g.

Special Character	Represents
\\	\
\"	11
\n	new line

Run?""" to see a complete list

Because of this, whenever a \ appears in a regular expression, you must write it as \\ in the string that represents the regular expression.

Use writeLines() to see how R views your string after all special characters have been parsed.

```
writeLines("\\.")
writeLines("\\ is a backslash")
#\is a backslash
```

INTERPRETATION

Patterns in stringr are interpreted as regexs. To change this default, wrap the pattern in one of:

regex(pattern, ignore_case = FALSE, multiline = FALSE, comments = FALSE, dotall = FALSE, ...) Modifies a regex to ignore cases, match end of lines as well of end of strings, allow R comments within regex's, and/or to have. match everything including \n.

str_detect("I", regex("i", TRUE))

fixed() Matches raw bytes but will miss some characters that can be represented in multiple ways (fast). str_detect("\u0130", fixed("i"))

coll() Matches raw bytes and will use locale specific collation rules to recognize characters that can be represented in multiple ways (slow). str_detect("\u0130", coll("i", TRUE, locale = "tr"))

boundary() Matches boundaries between characters, line_breaks, sentences, or words. str_split(sentences, boundary("word"))

[:graph:]

[:space:] [:blank:]

LOOK AROUNDS

Regular Expressions - Regular expressions, or regexps, are a concise language for describing patterns in strings.

MATCH CHARACTERS		see <- function(rx) str_view("abc ABC 123\t.!?\\()\{}\n", rx)		
string (type this)	regexp (to mean this)	matches (which matches this)	example	
	a (etc.)	a (etc.)	see("a")	abc ABC 123 .!?\(){}
\\.	\.		see("\\.")	abc ABC 123 .!?\(){}
\\!	\!	!	see("\\!")	abc ABC 123 . <mark>!</mark> ?\(){}
\\?	\?	?	see("\\?")	abc ABC 123 .! <mark>?</mark> \(){}
\\\\	11	\	see("\\\\")	abc ABC 123 .!?\(){}
\\(\((see("\\(")	abc ABC 123 .!?\ <mark>(</mark>){}
\\)	\))	see("\\)")	abc ABC 123 .!?\(<mark>)</mark> {}
\\ {	\{	{	see("\\{")	abc ABC 123 .!?\(){}
\\}	\}	}	see("\\}")	abc ABC 123 .!?\(){}
\\n	\n	new line (return)	see("\\n")	abc ABC 123 .!?\(){}
\\t	\t	tab	see("\\t")	abc ABC 123 .!?\(){}
\\s	\s	any whitespace (\ S for non-whitespaces)	see("\\s")	abc ABC 123 .!?\(){}
\/ d	\d	any digit (\ D for non-digits)	see("\\d")	abc ABC <mark>123</mark> .!?\(){}
\\w	\w	any word character (\W for non-word chars)	see("\\w")	abc ABC 123 .!?\(){}
\\ b	\ b	word boundaries	see("\\b")	abc ABC 123 .!?\(){}
	[:digit:]	digits	see("[:digit:]")	abc ABC 123 .!?\(){}
	[:alpha:]	letters	see("[:alpha:]")	abc ABC 123 .!?\(){}
	[:lower:]	lowercase letters	see("[:lower:]")	abc ABC 123 .!?\(){}
	[:upper:]	uppercase letters	see("[:upper:]")	abc <mark>ABC</mark> 123 .!?\(){}
	[:alnum:]	letters and numbers	see("[:alnum:]")	abc ABC 123 .!?\(){}
	[:punct:]	punctuation	see("[:punct:]")	abc ABC 123 .!?\(){}

look <- function(rx) str_view("bacad", rx)</pre>

look("a(?=c)")

look("a(?!c)")

look("(?<=b)a")

look("(?<!b)a")

example

see("[:graph:]")

see("[:space:]")

see("[:blank:]")

see(".")

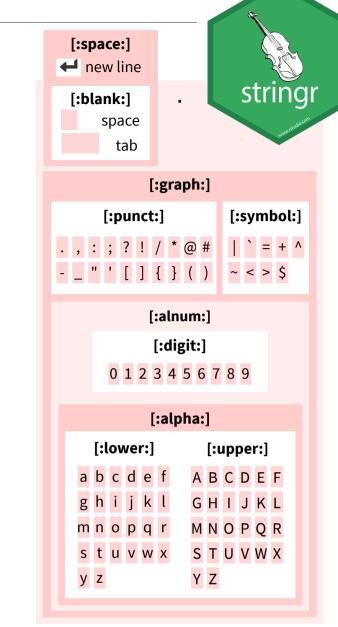

abc ABC 123 .!?\(){}

abc ABC 123 .!?\(){}

abc ABC 123 .!?\(){}

abc ABC 123 .!?\(){}

(ab|d)e

ALTERNATES alt <- function(rx) str_view("abcde", rx) example matches regexp abld abcde or alt("ab|d") [abe] alt("[abe]") abcde one of [^abe] anything but alt("[^abe]") abcde alt("[a-c]") abcde a-c range anchor <- function(rx) str_view("aaa", rx)</pre> **ANCHORS** example regexp matches ^a start of string anchor("^a") aaa a\$ end of string anchor("a\$") aaa

matches

followed by

preceded by

not followed by

not preceded by

regexp

a(?=c)

a(?!c)

(?<=b)a

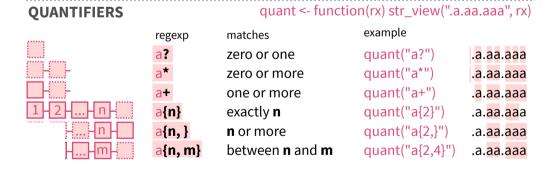

(?<!b)a

letters, numbers, and punctuation

space and tab (but not new line)

every character except a new line

space characters (i.e. \s)

ref <- function(rx) str_view("abbaab", rx) **GROUPS** Use parentheses to set precedent (order of evaluation) and create groups matches example regexp

alt("(ab|d)e")

abcde

Use an escaped number to refer to and duplicate parentheses groups that occur earlier in a pattern. Refer to each group by its order of appearance

sets precedence

string regexp matches (type this) (to mean this) (which matches this) (the result is the same as ref("abba")) \\1 first () group, etc. $ref("(a)(b)\\2\1")$ abbaab **\1** (etc.)

bacad

bacad

bacad

bacad

¹ Many base R functions require classes to be wrapped in a second set of [], e.g. [[:digit:]]
